

Certificate of 2021 GHG Quantification for Tacans AG and SpaceSeven AG

SuFu ApS has quantified the Greenhouse Gas Emissions of Tacans AG and SpaceSeven AG for the period 2021. Emissions for the remaining months of 2021 have been projected forward so that future GHG accounts can fall naturally on the year. Due to the nature of the business these projected emissions are calculated with high certainty.

For this period the emissions total: **514.11 tCO₂e**

Based on the GHG Protocol the GHG Emissions of Tacans AG and SpaceSeven AG are broken down into the following:

Scope 1: 0.0016 tCO₂e

Scope 2: 5.32 tCO₂e

Scope 3: 509 tCO₂e

1. Purchased Goods and Services (*Only cloud service usage*)

In SpaceSeven the minting of 1 NFT results in 34 g CO₂ e and is inclusive of CPU usage, data uploading and data storage.

All measurements and calculations have been performed inline with the WRI Greenhouse Gas Protocol. SuFu ApS has followed the Greenhouse Gas Protocol principles of relevance, completeness, consistency, transparency and accuracy throughout this quantification. Greenhouse gas measurement is however subject to inherent uncertainty from the use of models to determine emissions factors.
